COMPUTER SECURITY

ATG provides true advocacy computer consulting, implementation services, and support. We retain our clients' business by establishing and maintaining our role as trusted advisors.

The term computer security is a generalization for a collection of technologies which perform specific tasks related to data security. We use these technologies effectively to secure networks with an integrated overall security plan.

Our planning process for proper implementation includes:

- ▶ Maintaining a detailed understanding of potential environmental risks; e.g., viruses, hackers, and natural disasters;
- ▶ Performing a proactive analysis of the consequences of and counter-measures to security breaches in relation to risks; and
- ▶ Preparing a carefully planned strategy for integrating security measures into all aspects of the network, based on this understanding and analysis.

After considering our recommendations, clients make informed decisions for procurement, installation, and configuration of:

- ▶ Firewall(s)
- ▶ SSL-VPNs
- ▶ Multi-Tiered Threat Protection
- ▶ Intrusion Prevention
- ▶ Antivirus & Antispyware
- ▶ Computer Use Policy Development & Enforcement

ATG provides comprehensive security strategies and policies which dynamically adapt to proactively protect our clients' technology assets.
